RESPONSE TO NOTIFICATION OF NON-COMPLIANCE

WITH 37 C.F.R. § 1.192(C)

-AND-

SUPPLEMENTAL APPEAL BRIEF UNDER 37 C.F.R. § 1.193(b)

Mail Stop: APPEALS
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

TECHNOLOGY CENTER 2800

JUN 13 2003

RECEIVED

Dear Sir:

Appellant hereby requests reinstatement of the
appeal of the final rejection of Claims 1-6 in the subject
application and submits this supplemental appeal brief (in
triplicate) under 37 C.F.R. § 1.193(b)(2) in response to the
Office Action mailed on December 09, 2002 (Paper No. 15) and
the Notice of Non-compliance mailed on May 19, 2002 (Paper No.
17).

(1) Real Party in Interest

The real party in interest in the subject application is LSI Logic Corporation.

(2) Related Appeals and Interferences

No related appeals or interferences are known to appellant.

(3) Status of Claims

Claims 1-6 are pending in the subject application.

Claims 1, 4 and 5 stand finally rejected under 35 U.S.C. § 103(a) as being unpatentable over admitted prior art (APA) in view of U.S. Patent 5,997,174 to Wyland (*Wyland*).

Claims 2 and 3 stand finally rejected under 35 USC §103(a) as being unpatentable over admitted prior art in view of *Wyland* as applied to Claims 1, 4 and 5 and further in view of U.S. Patent No. 6,131,579 to Thorson et al. (*Thorson*).

Claim 6 stands finally rejected under 35 USC §103(a) as being unpatentable over admitted prior art in view of *Wyland* and further in view of U.S. Patent No. 5,585,577 to Lemoine (*Lemoine*).

(4) Status of Amendments

The amendments filed on May 8, 2001 (Amendment "A"), September 6, 2001 (Amendment "B"), October 24, 2001 (Amendment "C"), and May 1, 2002 (Amendment "D") have been entered.

(5) Summary of Invention

The present invention provides a thermal profiling device for accurately measuring the temperature at the interface between a semiconductor die and a packaging substrate of an integrated circuit during a reflow process in which the die is attached to the substrate. In one aspect of the present invention, a thermal profiling device for a flip-chip integrated circuit includes a packaging substrate of a flip-chip integrated circuit; a semiconductor die of the flip-chip integrated circuit having an active circuit surface for interconnecting the semiconductor die to the packaging substrate wherein the active circuit surface is secured to an upper surface of the packaging substrate; and a thermocouple secured directly to the active circuit surface of the semiconductor die for measuring a temperature of the active circuit surface of the semiconductor die during a reflow process.

(6) Issues on Appeal

The following issues are on appeal:

Issue 1: Whether motivation exists for modifying APA by Wyland; and

Issue 2: Whether modifying APA by Wyland would arrive at the claimed invention.

(7) Grouping of Claims

A statement that the claims of a group do not stand

or fall together is not included with this supplemental appeal brief.

(8) Argument

No motivation exists for modifying APA by Wyland

Claim 1 recites a thermocouple secured directly to the active circuit surface of a semiconductor die for measuring a temperature of the active circuit surface of the semiconductor die during a reflow process. The rejection admits that APA does not disclose the thermocouple secured directly to the active circuit surface of the semiconductor die as recited in Claim 1. The rejection argues that *Wyland* discloses locating a thermocouple (117) secured on a junction between surfaces (113, 114) for measuring and controlling a junction/interface temperature and that it would be obvious to modify APA by providing a thermocouple secured to the semiconductor die for measuring the junction/interface temperature as taught by *Wyland* to provide an enhancement for measuring die interface temperature. Appellant traverses the rejection as follows.

The rejection errs in alleging that the method of measuring temperature taught by *Wyland* teaches or suggests providing a thermocouple secured to the semiconductor die. As *Wyland* shows in FIG. 1A and explains in the abstract and column 4, lines 47 et seq., the thermocouple (117) is used to determine the junction temperature of a semiconductor die (122) inside a component package (121) by measuring the thermal resistivity of a board or coupon (113) outside the component package (121). The thermocouple (117) is attached between the surfaces of the coupon (113) and the thermally

conductive substrate (114) outside the component package (121) away from the semiconductor die (122). Because the thermocouple (117) is secured outside the component package (121) away from the semiconductor die (122), *Wyland* teaches away from the claimed invention that recites securing the thermocouple directly to the active circuit surface of a semiconductor die. Because *Wyland* teaches away from the claimed invention, there is no motivation to modify APA by *Wyland* as required by MPEP § 2143 (2100-124,125).

Modifying APA by *Wyland* would fail to arrive at the claimed invention

Even if there were motivation to modify APA by *Wyland*, such a modification would fail to arrive at the claimed invention. As shown in FIG. 1A, *Wyland* teaches securing the thermocouple (117) outside the component package (121) away from the active circuit surface of the semiconductor die (122).

Because modifying APA according to the teaching of *Wyland* would not result in securing the claimed thermocouple directly to the active circuit surface of the semiconductor die as recited in Claims 1 and 6, the combination of APA and *Wyland* fails to arrive at the claimed invention as required by MPEP § 706.02(j) (700-45).

Conclusion

Because no motivation exists for modifying APA according to the teaching of *Wyland*, and because such a modification would not arrive at the claimed invention, the rejection of Claims 1 and 6 under 35 U.S.C. § 103 over *Wyland* lacks reasonable support. Because the rejection lacks

Appeal page 6 of 8
09/465,131

DOCKET NO. 99-099/RCE
65611

reasonable support, Applicant requests that the rejection be withdrawn.

Because the rejections of Claims 2-5 rely on the same errors made in the rejection of Claims 1 and 6, the rejections of Claims 2-5 under 35 U.S.C. § 103 also lack reasonable support. Because the rejections of Claims 2-5 lack reasonable support, Applicant requests that the rejections of Claims 2-5 be withdrawn.

Respectfully submitted,

Eric James Whitesell

APPENDIX

Claims

1. A thermal profiling device for a flip-chip integrated circuit comprising:

a packaging substrate of a flip-chip integrated circuit;
a semiconductor die of the flip-chip integrated circuit having an active circuit surface for interconnecting the semiconductor die to the packaging substrate wherein the active circuit surface is secured to an upper surface of the packaging substrate; and

a thermocouple secured directly to the active circuit surface of the semiconductor die for measuring a temperature of the active circuit surface of the semiconductor die during a reflow process.

2. The thermal profiling device of Claim 1 wherein the thermocouple is secured using an adhesive.

3. The thermal profiling device of Claim 2 wherein the adhesive comprises an epoxy.

4. The thermal profiling device of Claim 1 wherein the active circuit surface has electrically conductive bumps formed thereon and the upper surface of the packaging substrate includes a plurality of bonding pads wherein the semiconductor die is positioned on the packaging substrate such that the electrically conductive bumps are in electrical contact with the plurality of bonding pads.

5. The thermal profiling device of Claim 4 wherein the packaging substrate and the semiconductor die are secured

in place by a solder bond between the electrically conductive bumps and the plurality of bonding pads.

6. A thermal profiling device for a flip-chip integrated circuit comprising:

a packaging substrate of a flip-chip integrated circuit having a first surface and a second opposite surface;

an opening passing through the second opposite surface and through the first surface of the packaging substrate;

a semiconductor die of the flip-chip integrated circuit having an active circuit surface for interconnecting the semiconductor die to the packaging substrate wherein the active circuit surface is secured to the first surface of the packaging substrate; and

a thermocouple secured directly to the active circuit surface of the semiconductor die through the opening for measuring a temperature of the active circuit surface of the semiconductor die during a reflow process.
